Justification

In 2004, Romanian Ministry of Environment and Waters Management issued the Order No. 374 for approval of the National Action Plan for the Conservation of the Dolphins in the Black Sea Romanian Waters. It has in view the provisions outlined in the ACCOBAMS Conservation Plan and Strategic Objectives. Present project acts to contribute of fulfilling of the overall objectives of this plan: Improvement of the scientific knowledge by research (B.4; B.4.2; B.4.3), monitoring and dissemination of information (B.1.3.1); Awareness (B.3), training and public involving local communities and professional associations in dolphin protection and conservation programs; providing a timely response to emergency situations; building institutional capacities.

In order to fulfil this, Romania and at the regional level, the other countries, stress the need of qualified specialists who will support the ACCOBAMS Objectives in present and future.

There are still many unknowns about the abundance and distribution of dolphins, who visit the Romanian Black Sea waters, as was noted at the workshop „The state and distribution of Cetaceans from Black Sea and Mediterranean”. The only relevant study in this direction is Adverse Fisheries Impacts on Cetacean Population in the Black Sea of MEP (2014). It can represent a mile stone for Black Sea cetacean research for the future monitoring programs of Black Sea countries and ACCOBAMS Black Sea second survey initiative. Now we can agree on an accepted methodology which can be applied by all scientists in Black Sea, in order to have comparative results on cetacean distribution and abundance.

Objectives

1. Increase the capacity of local and regional researchers to address the issues related to cetacean distribution and abundance (B.4) and aims to respond to ACCOBAMS strategic objective (R.5.1; B.1.1.3) on improving understanding of the conservation status of cetaceans in Black Sea.
2. Assure continuity, quality and quantity of data regarding Romanian Black Sea cetaceans.
3. Increase awareness and involvement of local population and tourists in cetacean conservation (stranding monitoring network, task force, emergency, appropriate behaviour etc.).

Area of the project

The Romanian Black Sea coastline extends for over 240 km, which can be divided into two main geographical and geomorphologic sectors: **the northern sector** (about 158 km in length) lies between the secondary delta of the Chilia branch and Constanta, is constituted of alluvial sediments; the shallow waters up to 20m depth of this sector is included in the Biosphere Reserve of Danube Delta (declared through the Law no. 82/1993); and **the southern sector** (about 85 km in length) lies between Constanta and Vama-Veche characterized by promontories with active, high cliffs, separated by large zones with accumulative beaches often protecting littoral lakes. The distance from the sea shore to the shelf limits (200 m depth) varies from 100-200 km in the northern sector to 50 km in the southern one. The submarine slope of the shelf is very gentle in the north, with the 10 m depth in front of Danube mouths, while in the southern sector the 10 m depth is nearly 1,5 km offshore.

The project is implemented mainly in the southern part of the Romanian marine area (Fig. 1), between Constanta and Vama-Veche. The activities conducted in the Northern part cover land surveys, awareness, training of the monitoring network members and emergency interventions.

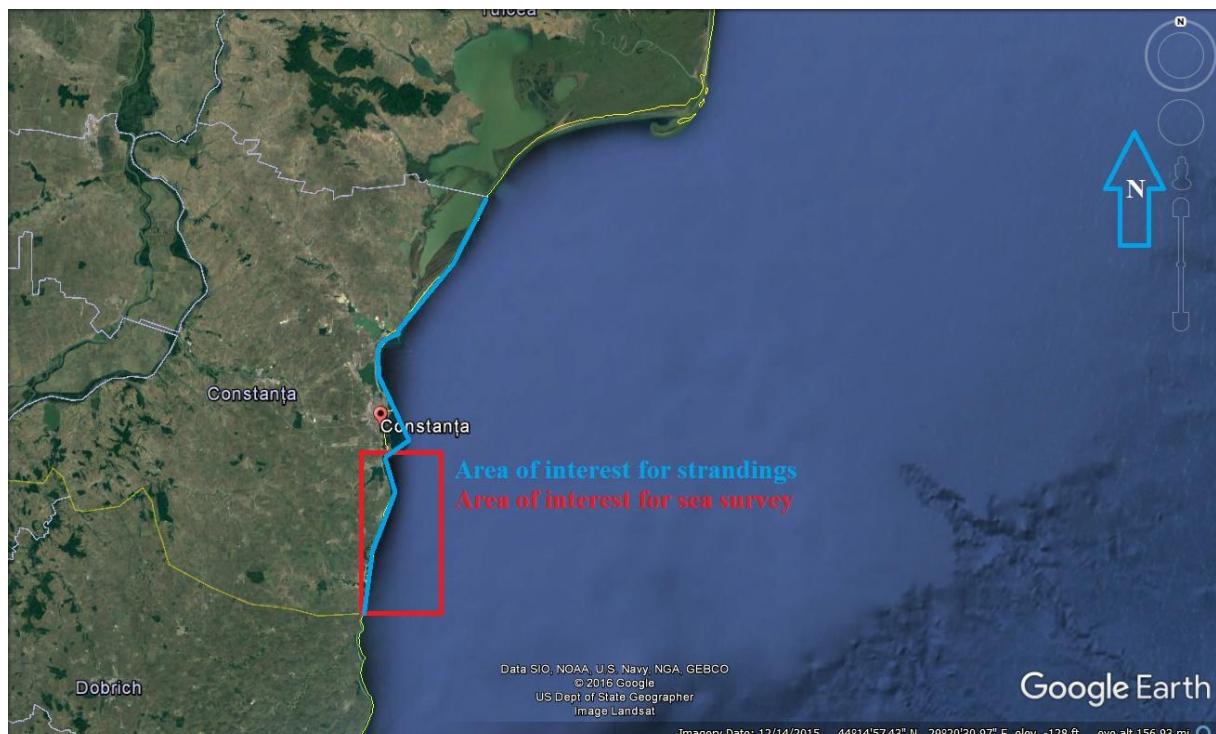

Fig. 1. Map of the area of the project

ACTIVITIES CARRIED OUT DURING THE REPORTING PERIOD

For achieving the objectives of the project the activities were split in two categories. The first category includes the activities related to reinforcing local/regional capacities to conserve cetaceans by developing cetacean distribution and abundance studies (A1-A4) and the second category covers activities assuring continuity of Mare Nostrum Program for monitoring and conservation of Black Sea cetacean (A5-A8). The last activity (A9) covers the reporting segment of the project, with a progress report and a final report.

A1. International training workshop for researchers/students on marine mammal distribution and abundance

The training took place between 12-16 of December 2016, in Constanta, Romania and was held by Philip S. Hammond BA, DPhil (Professor of Marine Ecology) affiliated to the Sea Mammal Research Unit, University of St. Andrews with the support of Dr. Lindsay Porter, SMRU Consulting Asia Pacific. At the training participated a total of 15 trainees (Annex 1) from Romania, Bulgaria, Turkey, Georgia and Ukraine from which 7 persons were supported by the project and 6 thought the additional financial support MoU No 15/2016/LB 6900 et LB 1201. The additional 2 persons till 15 are within Mare Nostrum members.

The training workshop aimed at building capacities of scientist from the Black Sea on estimating cetacean abundance and population parameters, and on spatial modelling of habitat usage and abundance (Annex 2). The workshop covered mark-recapture methods, mark and distance software, line transect method, population status and trends including power analysis (Annex 3).

Selection of the participants was made in collaboration with the ACCOBAMS Secretariat from a list of 25 requests (one none completed) (Annex 4).

The final participants to the training were (Fig.2):

1. Ro - Paiu Marian (Romania) – Mare Nostrum NGO
2. Ro - Filimon Adrian (Romania) – National Institute of Marine Research and Development "Grigore Antipa"
3. Ro - Vasile Alexe – Danube Delta National Institute for Research and Development
4. Bg - Dimitar Popov (Bulgaria) – Green Balkans
5. Ge - Nana Devidze (Georgia) – Illia State University
6. Tk - Arda Tonay (Turkey) - Istanbul University/TUDAV
7. Uk - Pavel Cold'in (Ukraine) - Schmalhausen Institute of Zoology, National Academy of Sciences of Ukraine
8. Bg - Marina Panayotova – IOBAS, Institute of Oceaqnology Bulgarian Academy of Science
9. Ge - Davit Dekanoidze – Illia State University
10. Tk - Ertug Duzgunes - Karadeniz Technical University, Faculty of marine sciences
11. Uk - Oksana Savenko - Ukrainian Scientific Center of Ecology of the Sea (UkrSCES)
12. Tk – Ayaka Amaha Ozturk - Istanbul University/TUDAV
13. Bg - Konstantin Mihaylov – Institute of Fisheries Resources
14. Ro - Mihaela Mirea Cândea – Mare Nostrum NGO (additional)
15. Ro - Dan Kessler – Mare Nostrum NGO (additional)

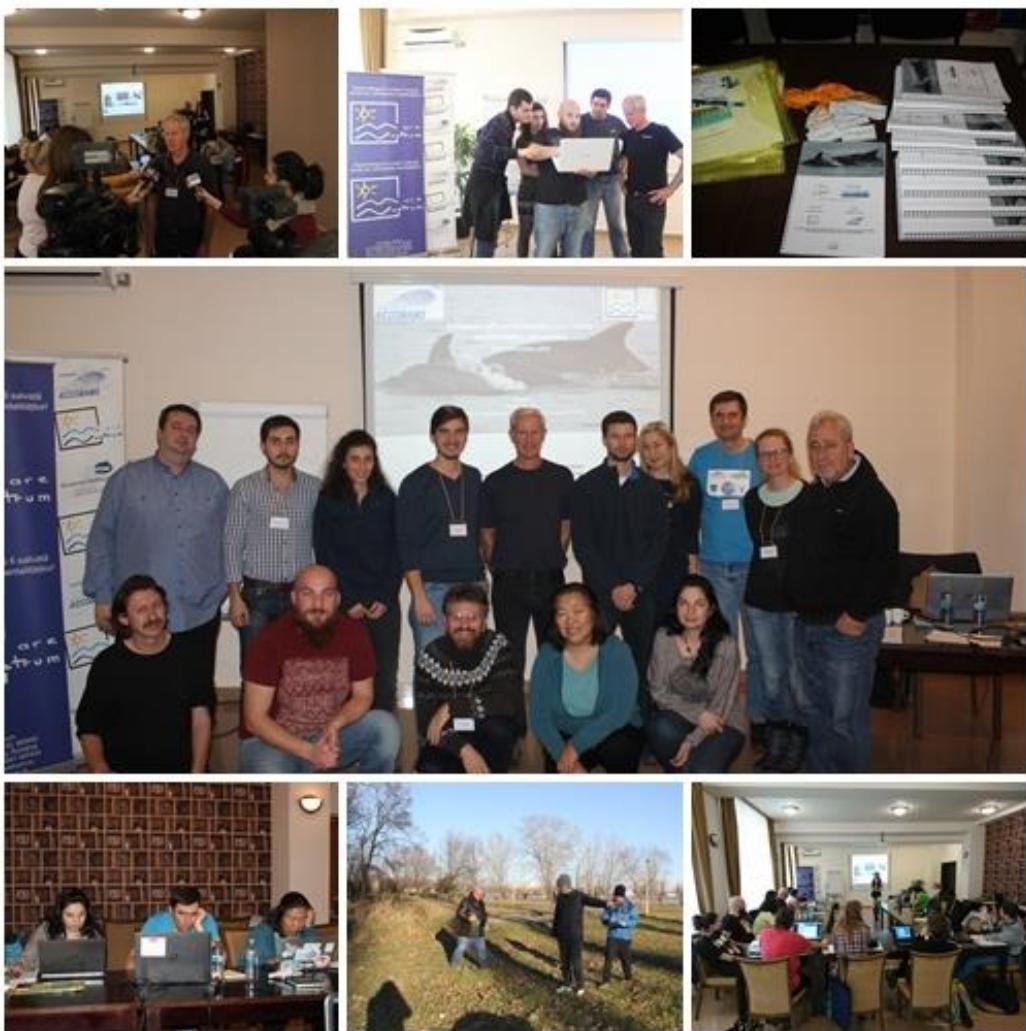

Fig. 2. Training workshop participants

A2. Establish a local survey plan for 12Nm area between Agigea (North 44.0823445N 28.6417866E) and Vama-Veche (South 43.7425146N 28.5793877E)

The area is overlapping several protected areas (Natura 2000): ROSCI 0269 Vama Veche-2Mai, ROSCI 0273 Marine area from Cape Tuzla, ROSCI0094 Submarine sulphurs springs from Mangalia, ROSPA0076 Black Sea and is around 1000 km². One usable output of the activity are the cetacean sightings map showing the distribution and dissemination in the area of the pilot survey which will be a resource for future declaration of MPA or changing the management plans for the existing MPA.

The activity provided the opportunity for the Romanian trainees to use the knowledge from the training as good practice example and a step forward in establishing a common methodology for cetacean monitoring in all the Black Sea. The training gave the necessary information and the trainers were able to give us advices and work with us at the development of the survey plans and also for the assessment of the data.

First survey plan was sent to the ACCOBAMS secretariat for consultation, and did not receive any comments for modification. The survey plan included 8 line transects, perpendicular on the shore line,

covering the 12 NM area of Romanian Black Sea (Fig.3.). The length of the transects vary between 25.395 km and 28.295 km (for the Spring survey) respective 25.415 km and 28.852 km for the (Summer survey), with a distance between transects of 5 km.

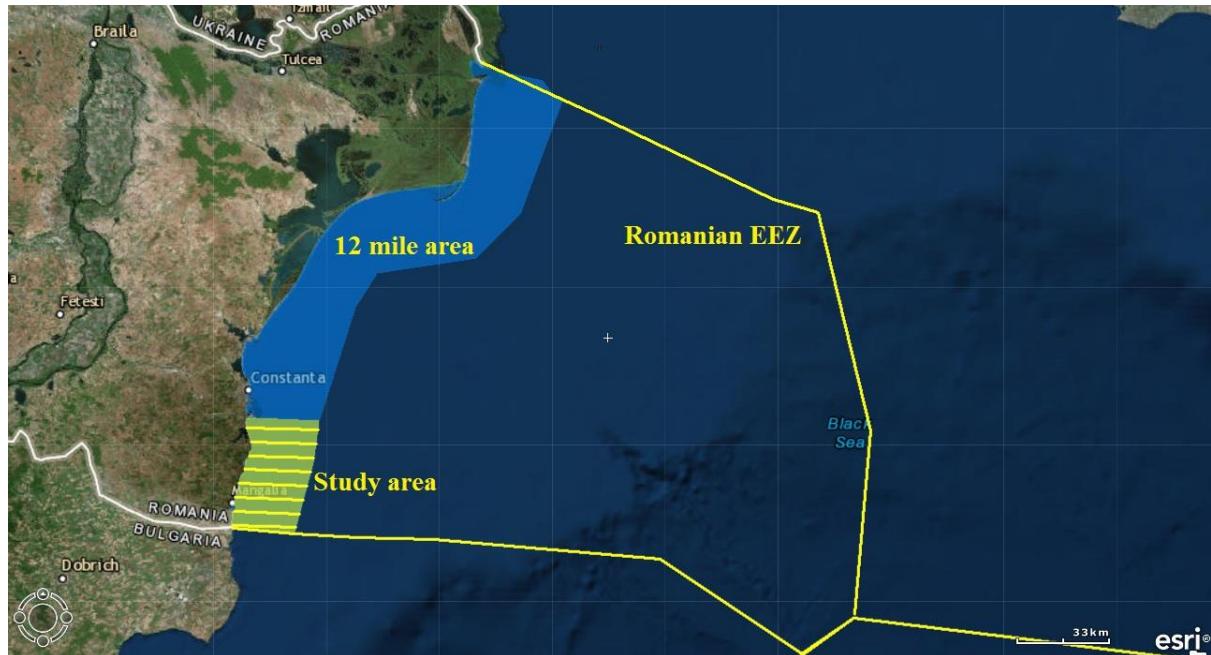

Fig.3. Romanian EEZ and territorial waters where the surveys took place

The method used was distance line transect, the vessel followed pre-determined track lines throughout the territorial sea/internal waters. Double platform line transect techniques were used to collect distance sampling data. Surveying was conducted when the wind was Beaufort force four or below and the visibility was good. The survey was carried out in “passing mode”: the vessel did not approach any cetaceans sighted. All sightings data were recorded on pre-prepared data sheets and entered into a database at the end of a survey day.

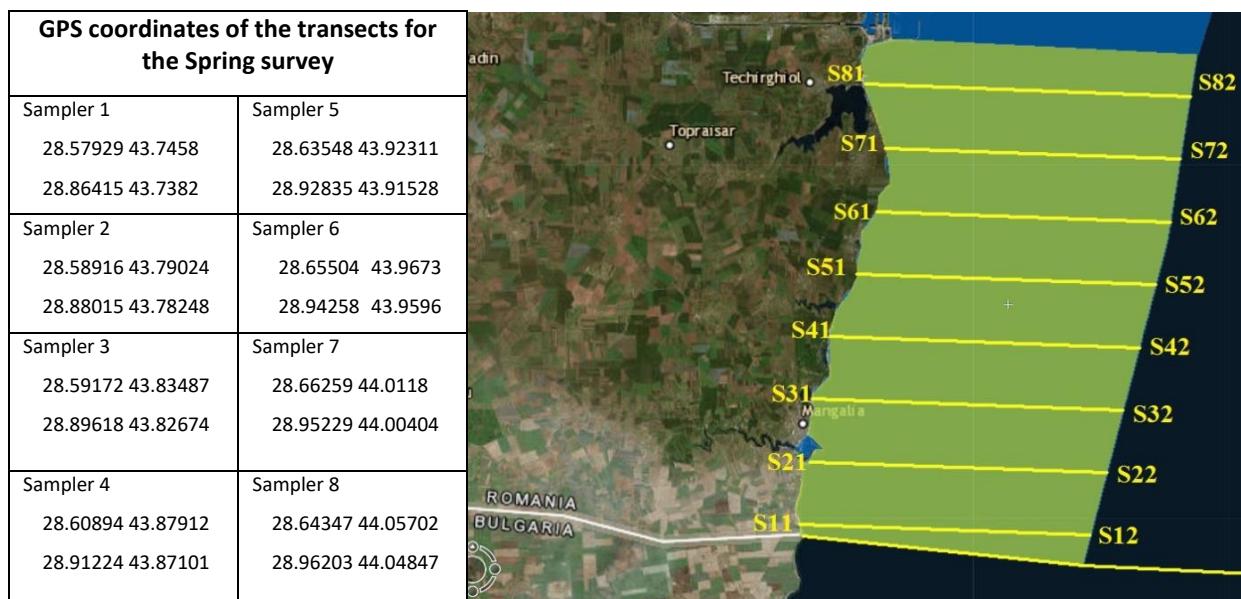

The data was treated as a single platform survey by combining the sightings from observation platform and photographer platform and removing duplicate sightings. The data was processed and analyzed by means of Distance 7.0 program package¹. The surface of the survey was 1063 km², with 211.95 km of track and coverage of 0.39%.

Comparing two models Systematic random sampling and Equal Spaced ZigZag for the same line length the coverage of first model was higher and more appropriate to the surveyed area.

Due to the restrictions imposed by the budget and existing facilities was chosen to develop a combine methodology, a mix between single platform survey and photo identification platform (which was acting as tracker and for increasing the confidence of data by checking the observations of the observer platform).

¹Thomas, L., Laake, J.L., Rexstad, E., Strindberg, S., Marques, F.F.C., Buckland, S.T., Borchers, D.L., Anderson, D.R., Burnham, K.P., Burt, M.L., Hedley, S.L., Pollard, J.H., Bishop, J.R.B. and Marques, T.A. 2010. *Distance 7.0. Release 1. Research Unit for Wildlife Population Assessment, University of St. Andrews, UK.*
<http://www.ruwpa.st-and.ac.uk/distance/>

Coordinates and map for the first survey plan (Spring survey):

A3. Conduct the two sea surveys according to the agreed plan

The area is overlapping several protected areas (Natura 2000): ROSCI 0269 Vama Veche-2Mai, ROSCI 0273 Marine area from Cape Tuzla, ROSCI0094 Submarine sulphurs springs from Mangalia, ROSPA0076 Black Sea and it was 1063 km².

For the good progress of the project, were bought several equipments that helped the data collection activities, for this mention: 2 Garmin Etrex GPS and 2 Fujinon binoculars, 4 angle boards and one Sony voice recorder.

There were conducted two vessel surveys: one in Spring and one in Summer, on the same area but on different survey plan (other transects, this was a suggestion of Dr. Phil Hammond). The second survey plan output the tracks beginning and finishing more North.

There were conducted two trainings, one before each survey, because the team members from the first survey changed. In the first training were trained 10 observers and for the second 13 observers, which were used in the survey in teams of 7 observers for first survey (Spring survey) and 6 observers for the second survey (Summer survey) (Fig.4.).

Fig 4. Spring and Summer vessel survey

First survey was done in April 2017, on 7, 28, 29, over three days, recording 59 sightings with a total of 137 individuals, but just from two species: *Tursiops truncatus ponticus* (Fig.5.) and *Phocoena phocoena* (Fig.6.). The data collected and analyzed revealed an estimation of: 359 harbour porpoise and 667 bottlenose dolphins (table 2).

Fig.5. *Tursiops truncatus ponticus* sighted in April 2017 vessel survey

Fig. 6. *Phocoena phocoena relicta* sighted in April 2017 vessel survey

The second survey was done in June 2017, between 26-28, recording 216 sightings with 340 individuals (Fig. 7.), from all the three species inhabiting the Black Sea.

Fig. 7. Cetacean sightings registered in the second survey (from left to right: Harbour porpoise; Common dolphins; Bottlenose dolphins)

A total of 275 sightings of Black Sea cetaceans of all three species have been recorded and analysed as is presented in the table 1.

Table 1. Observation effort and number of animals recorded during the two boat surveys in the 12-mile wide inshore zone of South Romanian Black Sea

Season	Survey area, km ²	Observation effort			Sighted animals					
		km	hours	min	<i>P. p. relicta</i>		<i>D. d. ponticus</i>		<i>T.t. ponticus</i>	ani mals
					sightings	animals	sightings	animals	sightings	
Spring	1063	211.95	18	13	36	73	0	0	23	64
Summer	1063	212.39	18	48	183	281	7	9	26	50

Results of the two surveys:

Spring survey:

Over the 8 transects surveyed in April were sighted two from the three species of cetacean inhabiting the Black Sea, *Tursiops truncatus ponticus* and *Phocoena phocoena relicta* with 23 sightings of bottlenose dolphin and 36 sightings of harbour porpoise (Table 2). There were four transects with no sighted cetaceans and on other three with just one sighting (one with single animal and two groups of three)(Fig. 8.).

Fig. 8. Cetacean sightings during the vessel-based survey from Spring (April) in the surveyed area (Black dots – Harbour porpoise; Red dots – Common dolphins; Blue dots – Bottlenose dolphins)

The uncorrected values of the two species sighted in the spring survey density and absolute numbers estimated are shown in table 2.

Table 2. Density and abundance of Harbour porpoises and Bottlenose dolphins in Spring for the surveyed area

Species	Density of groups, groups/km		Density of animals, indiv./km ²		Number of animals		CV%
	DS	95% CI	D	95% CI	N	95% CI	
<i>P.p. relicta</i>	0.166	0.592-0.467	0.337	0.119-0.955	359	127-1015	50.87
<i>T. t. ponticus</i>	0.216	0.708-0.659	0.627	0.201-1.957	667	214-2080	59.92

Harbour porpoises (36 sightings; 73 animals) have been observed on the study area (Fig. 9.). The distribution of sightings was more or less homogenous over the study area with higher density in the southern half. The data collected show that porpoises are solitary animal (13 sightings; 36% of the total) or live in pair (12 sightings; 34% of the total), the largest group in a single sighting was composed of 4 animals (3 sightings; 8 % of the total)(Fig.10).

Fig. 9. Sightings of Harbour porpoise (black spots) during the vessel-based survey in the internal waters of Romania, South part.

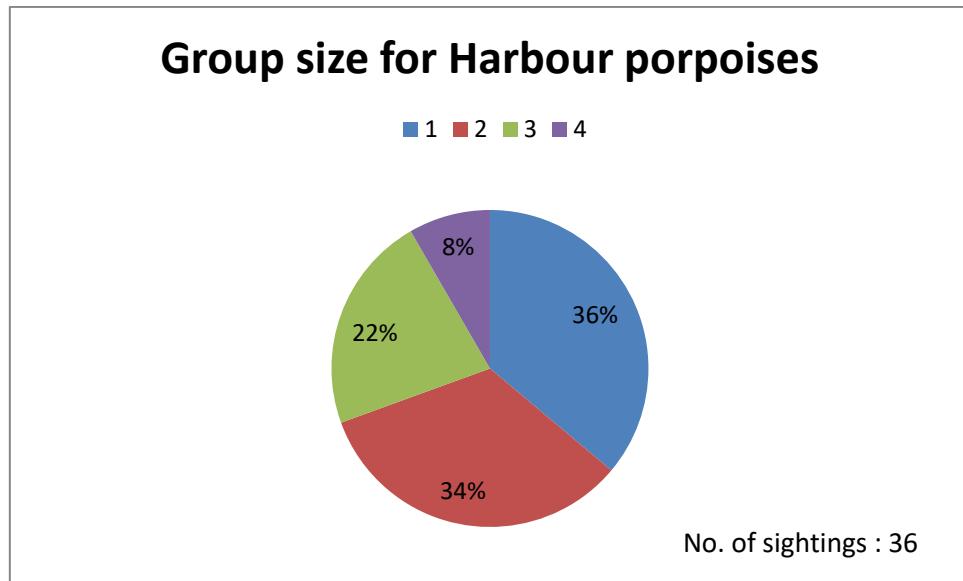

Fig.10. Group size for *Phocoena phocoena relicta* (Harbour porpoise)

Bottlenose dolphins (23 sightings; 64 animals) have been observed on the study area (Fig. 11.). The distribution of sightings was more or less homogenous over the study area with higher density in the southern half. The data collected show that bottlenose dolphins are like the porpoises solitary animal (6 sightings; 26% of the total) or live in pair (7 sightings; 31% of the total), the largest group in a single sighting was composed of 8 animals (3 sightings; 4 % of the total)(Fig.12.).

Fig. 11. Sightings of Bottlenose dolphin (blue spots) during the vessel-based survey in the internal waters of Romania, South part.

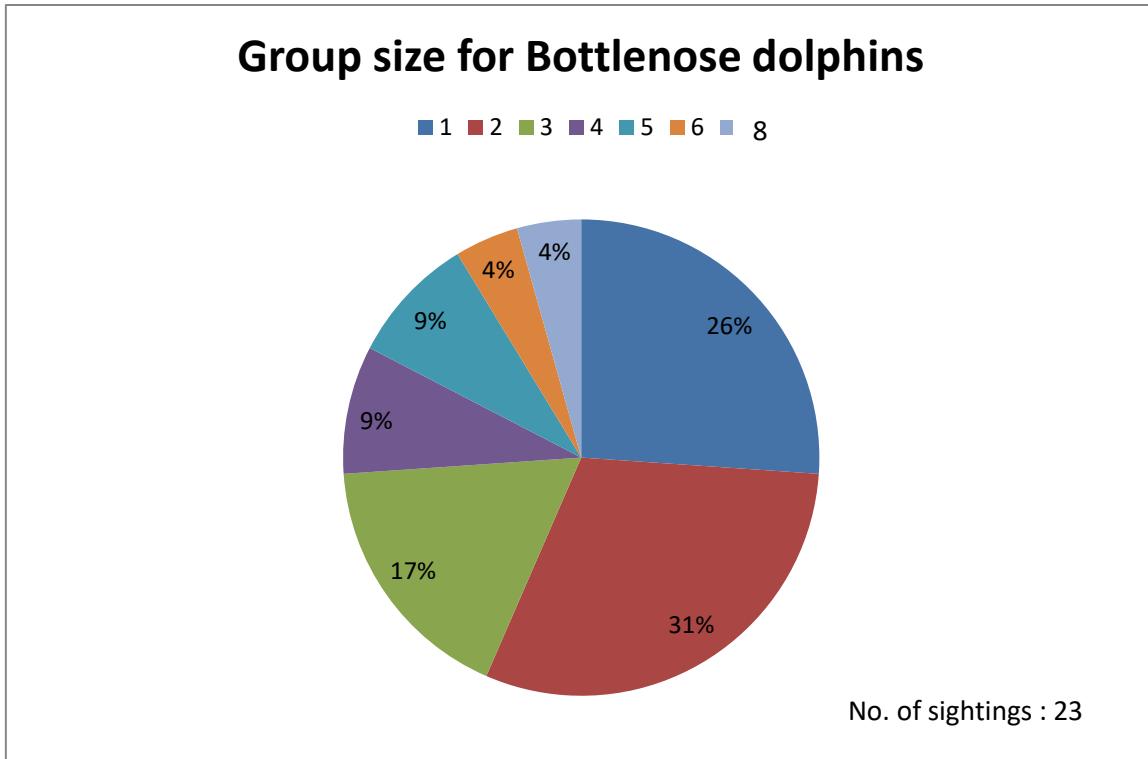

Fig.12. Group size for *Tursiops truncatus ponticus* (Bottlenose dolphin)

Summer survey:

Over the 8 transects surveyed in June were sighted all the three species of cetacean inhabiting the Black Sea, *Tursiops truncatus ponticus*, *Delphinus delphis ponticus* and *Phocoena phocoena relicta* with 26 sightings of bottlenose dolphin, 7 sightings of common dolphin and 183 sightings of harbour porpoise (Table 2)(Fig. 13).

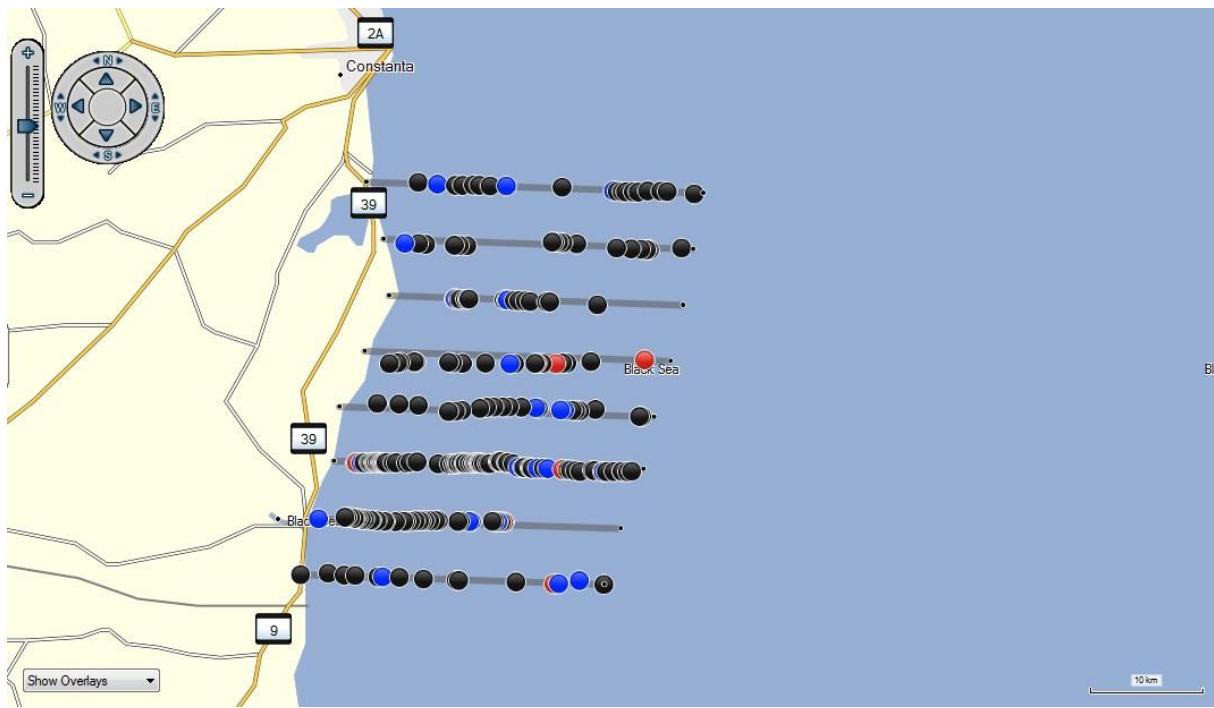

Fig. 13. Cetacean sightings during the vessel-based survey in Summer (June) in the surveyed area (Black dots – Harbour porpoise; Red dots – Common dolphins; Blue dots – Bottlenose dolphins)

The uncorrected values of the three species sighted in the Summer survey density and absolute numbers estimated are shown in table 3.

Table 3. Density and abundance of Harbour porpoises and Bottlenose dolphins and Common dolphins in Summer for the surveyed area

Species	Density of groups, groups/km		Density of animals, indiv./km ²		Number of animals		CV%
	DS	95% CI	D	95% CI	N	95% CI	
<i>P.p. relicta</i>	3.47	1.834-6.563	5.359	2.821-10.183	5697	2999-10824	28.64
<i>T. t. ponticus</i>	0.22	0.105-0.461	0.424	0.194-0.927	451	207-986	38.75
<i>D. d. ponticus</i>	0.119	0.389-0.366	0.153	0.491-0.480	163	52-510	56.94

Harbour porpoises (183 sightings; 281 animals) have been observed on the study area (Fig. 14.). The data collected show that porpoises are solitary animal (133 sightings; 72.68% of the total) or live in pair (31 sightings; 16.94% of the total), the largest group in a single sighting was composed of 12 animals (1 sightings; 0.55% of the total)(Fig.15).

Fig. 14. Sightings of Harbour porpoise (black spots) during the vessel-based survey in the internal waters of Romania, South part.

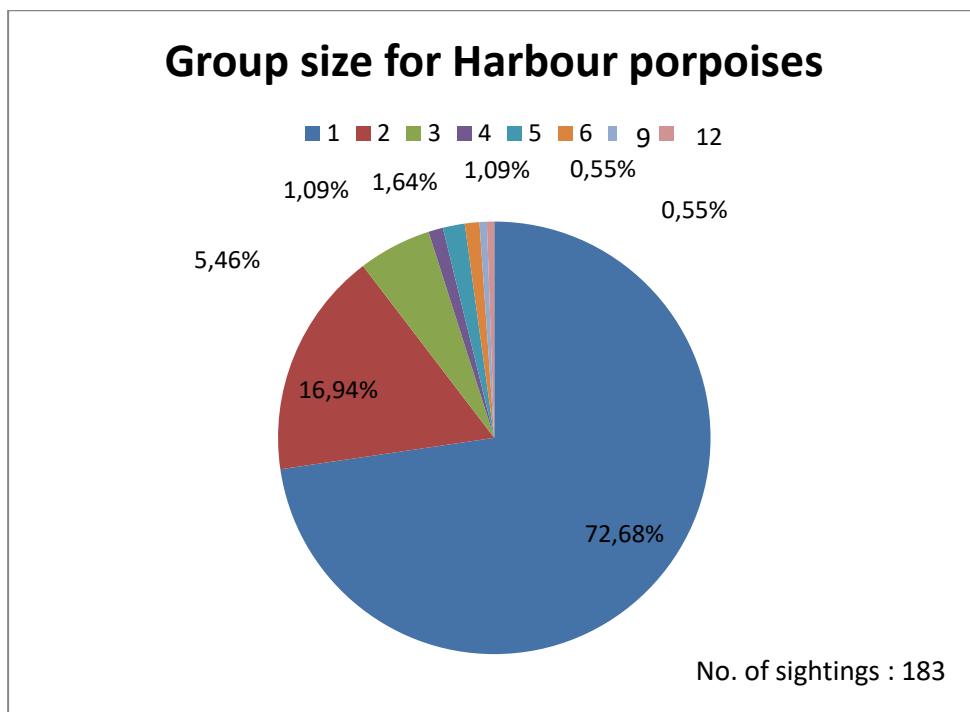

Fig.15. Group size for *Phocoena phocoena relicta* (Harbour porpoise)

Bottlenose dolphins (26 sightings; 50 animals) have been observed on the study area (Fig. 16.). The data collected show that encountered bottlenose dolphins were solitary animal (13 sightings; 50% of

the total) followed by live in pair (9 sightings; 34% of the total), the largest group in a single sighting was composed of 8 animals (1 sightings; 4 % of the total)(Fig.17.).

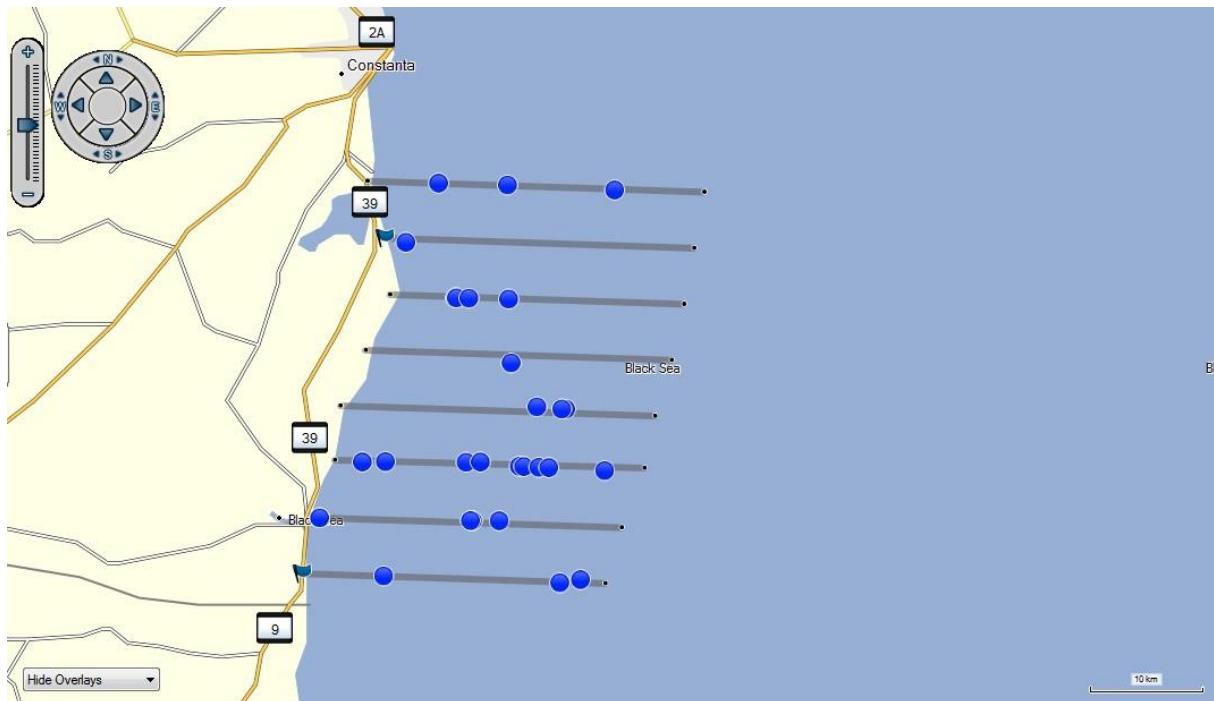

Fig. 16. Sightings of Bottlenose dolphin (blue spots) during the vessel-based survey in the internal waters of Romania, South part.

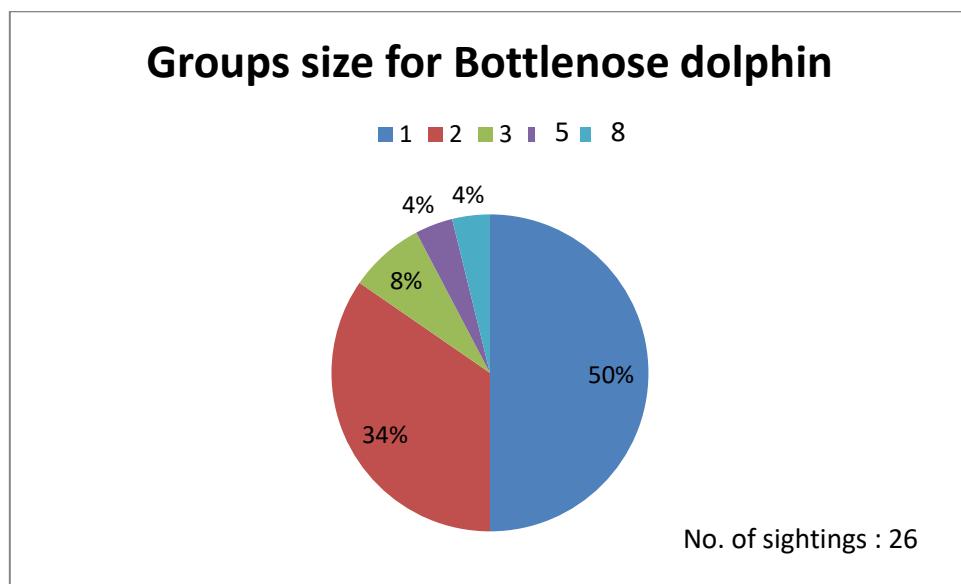

Fig.17. Group size for *Tursiops truncatus ponticus* (Bottlenose dolphin)

Common dolphins (7 sightings; 9 animals) have been observed on the study area (Fig. 18.). The data collected show that encountered common dolphins were solitary animal (5 sightings; 83% of the total) and two in pair (2 sightings; 17% of the total)(Fig.19.).

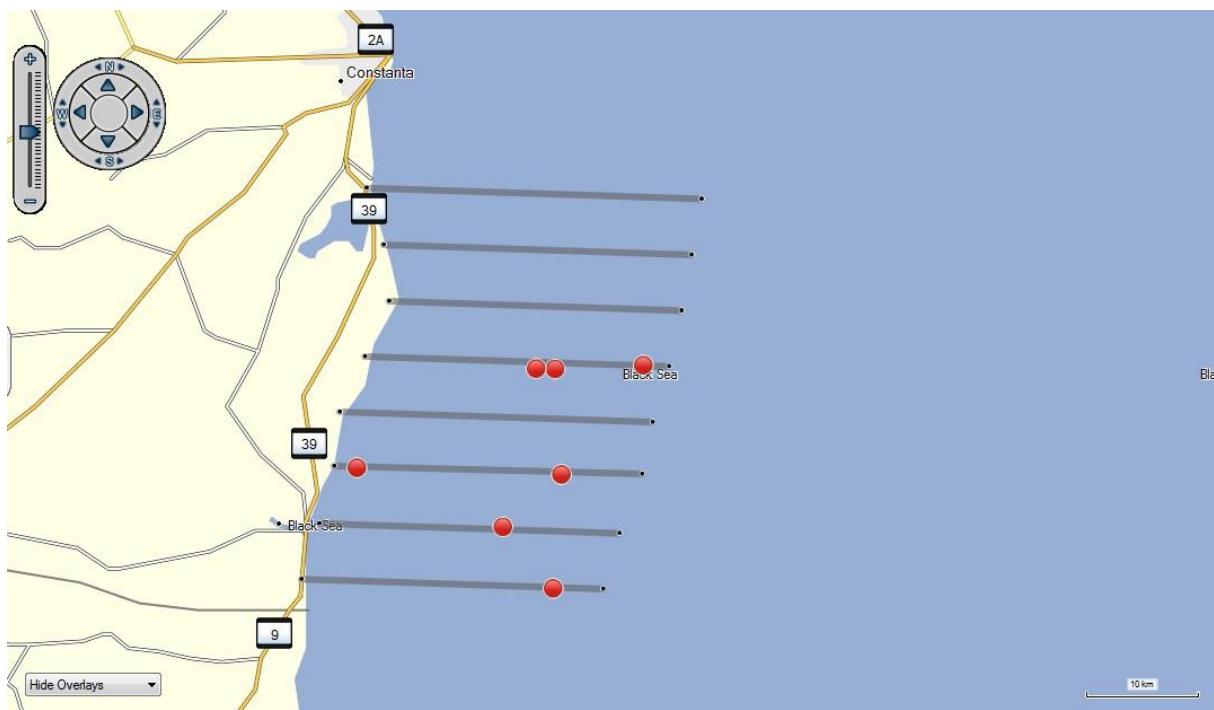

Fig. 18. Sightings of Common dolphin (red spots) during the vessel-based survey in the internal waters of Romania, South part.

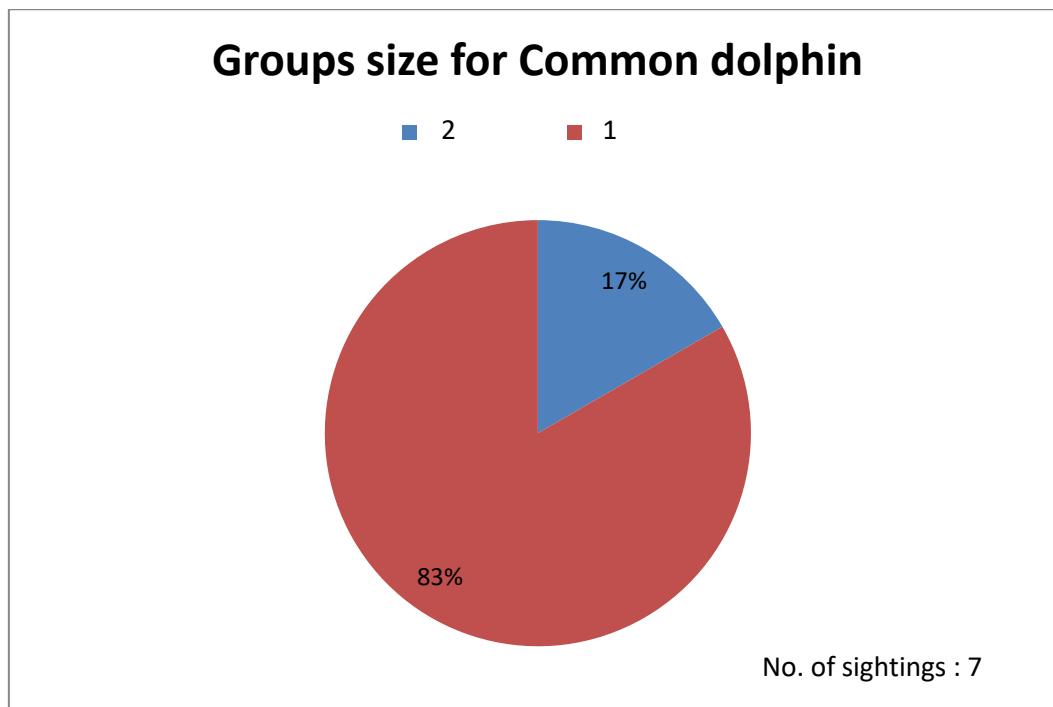

Fig.19. Group size for *Delphinus delphis ponticus* (Common dolphin)

A4. Revision of the survey plan according to in situ situations

After the first survey, done in April, the survey plan was first changed in order to have different tracks and also the team's position was modified on the boat but furthered was kept the mix platform

method. The result was the second survey plan, for the Summer period which was covering the same 1063 km² area over 8 track lines perpendicular on shore (Fig. 20)(Table 4).

The passage period allowed the team members to rest and lower the number of observes on board. Still was chosen to have a spare observer in case of health problem of one of the team members or incapacity to work. Even though the daylight could provide plenty hours of work, the rough conditions of the sea and weather forced the team to work just from the sunrise till short after lunch.

Second survey plan, was also done using the Distance 7 software package using the knowledge and support from the training in December, lead by Dr. Phil Hammond, over the same parameters with a random start point which give a new survey plan which was starting 1.65 km north than the first survey plan.

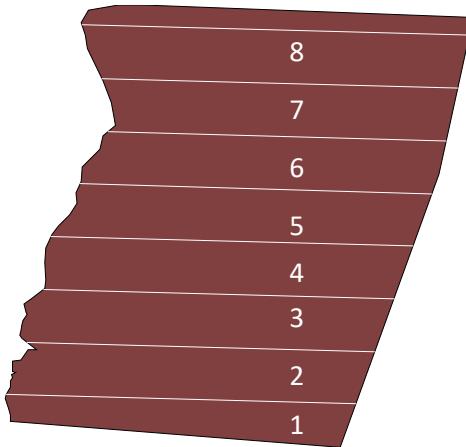

Fig.20 Map of the distribution of transects for the second survey plan

Tabel 4. GPS coordinates of the transects for Summer survey

GPS coordinates of the transects	
Sampler 1 28.57929 43.7458 28.86415 43.7382	Sampler 5 28.63548 43.92311 28.92835 43.91528
Sampler 2 28.58916 43.79024 28.88015 43.78248	Sampler 6 28.65504 43.9673 28.94258 43.9596
Sampler 3 28.59172 43.83487 28.89618 43.82674	Sampler 7 28.66259 44.0118 28.95229 44.00404

Spacing between lines was 5 km, with a total length of the trackline of 257.946 km, with a coverage of 423,31 km² giving a 0.398% of the stratum sampled.

A5. Develop the Cetacean Stranding Monitoring Network (called Ocroteşte delfinii!/Preserve the dolphins!)

From 2010, Mare Nostrum NGO is managing the cetacean stranding monitoring network for Romania. The members are split in two categories students + teachers and workers from companies, authorities, NGO's who are working or their work is related to the sea and coastal area. In September 2016, was lunched the enrolling session of new members and received 23 requests from the educational institutions to be part of the network for 2016-2017. In October were finalized the training for 897 students and 106 teachers (Table 5) in order to share the knowledge need to assess properly the stranding events and also to collect data for stranding and in situ observation but also the first aid in case of live stranding (Fig. 21).

Fig. 21. Training sessions for new members of the CSMN

Every month the groups of volunteers were surveying the designated sector of costal area and send information to Mare Nostrum (Fig. 22).

Fig. 22. Members of the CSMN on the field

Total new trained volunteers for the Stranding Monitoring Network					897	103

Each group was equipped with a field kit in order to conform to the data collection protocol, with basic materials (gloves, masks, ruler, pen, observation sheets and educational and informative materials) and was instructed for the data collection and picture collection.

The first aid drill comprises the knowledge over the ecology of cetaceans, and right procedures according to different situations (stranding on shore, stranding in shallow waters and by-catch). For their knowledge we presented also the recommendations for boat governance in presence of cetaceans (the information are found also in the Photo-ID catalog printed in 2014).

The 23 groups established in the CSMN for 2016-2017 were conducting monthly or bimonthly monitoring sessions over the given beach sector. In June, with the end of the school year we finalized this session and prepared and deliver the diplomas for the active members, over 800 (Fig.23).

Fig.23. Diploma for active members of the Cetacean Stranding Monitoring Network

For a better acknowledge and support of the network were made three training sessions for the employees of the Romanian Water Administration, a total of 22 persons trained, and established a more suitable way to collaborate and share information. Were updated the contacts and working flux with the Danube Delta Biosphere Reserve, Coastal Guard, Fisheries, Danube Delta Research Institute, National Research Institute for Marine Research and Development whit which we manage to establish an sampling laboratory for collecting samples from dead stranded cetaceans in respect with the MoU for cetacean disease research established in the past with Veterinary Universities from Romania and Czech Republic but also research and educational institutions from the area. The collaboration grows with the Parasitological Lab from University of Valencia from which we had also a student working with us from April to June, 2017 (Fig. 24).

Fig. 24. Necropsy and sampling dead stranded porpoise from May 2017

A6. Emergency Task Force

24/7 a team is ready to response at distress signal (received at the nonstop phone number 0040763255731) related to cetacean. In order to cover as much as possible the necessities of an emergency situation, we collaborate closely with the County Sanitary Veterinary Inspectorate, Coastal Guard, Port Administrations, National Institute of Marine Research and Development, National Institute Danube Delta, Danube Delta Biosphere Reserve Administration and Veterinary Universities from Bucharest, Cluj (Romania) and Brno (Czech Republic). Beside this core, we keep close collaboration with local universities and research institutes.

From June to December 2016, the team answered to 22 distress calls from the emergency line, identifying a total of 22 stranded cetaceans: 17 harbour porpoises, 3 bottlenose dolphins and 2 common dolphins (Table 6). There were 10 more recordings of harbour porpoies (*Phocoena phocoena relicta*), 8 stranded in the North part of Romanian coast, between Sulina and Sfântul Gheorghe and 2 in Constanta and Mamaia which we did not identified at the site.

Over the second period of the project till 21 of July 2017, there were enrolled 110 interventions, after receiving distress call for strandings along the coast as presented in table 5 of the present report. From the 110 cetaceans assessed were identified: 101 harbour porpoises (*Phocoena phocoena relicta*), 6 bottlenose dolphins (*Tursiops truncatus ponticus*) and 3 common dolphins (*Delphinus delphis ponticus*) (Table 7). There were 20 more recordings of harbour porpoises (*Phocoena phocoena relicta*) and bottlenose dolphins (*Tursiops truncatus ponticus*) stranded in the North part of Romanian coast, between Sulina and Sfântul Gheorghe but with evidence just for 6 individuals, received till the preparation of the report.

2017 was placed in second with high number of dead cetacean strandings, exceeded just by 2012 year in which were recorded 177 strandings, all year and more than 130 for the same period.

Also this year brought the first mass stranding event on the Romanian sea shore in the last 7 years, with 8 harbour porpoises stranded on 800 m of beach in Navodari area, individuals of both sexes and ages but most of them in advance state of decomposition.

A7. Collecting data concerning cetacean strandings, accidental catches and near coast appearance in the area between Vadu and Vama Veche (land survey)

A total of 18 monitoring expeditions (from the first month of the project to the last) along the coast between Vadu and Vama-Veche are planned to be done during the implementation of the project. The frequency of the monitoring expeditions was 2/month (May-October) in the warm period and 1/month (November-April).

In the end there were done 22 monitoring surveys: 14 in the first period (July-December 2016) and 8 in the second period (January- July 2017) as follows:

- For the period July – December were planed 10 monitoring surveys but were made 4 additional (1 in July, 2 in August and 1 in November) because of the high emergency calls received ending with a total of 14 monitoring expeditions. The sessions involved more than 60 volunteers (Fig.25) and over the 14 sessions registered 3 harbour porpoise (*Phocoena phocoena relicta*) (Annex 5). A total of 35 cetacean stranding events were registered in the period reported, 22 emergency interventions, 3 land surveys and 10 by the monitoring network.

Fig. 25. Land monitoring sessions in 2016

- For the period January – July 2017 were done 8 land surveys involving 36 volunteers (Fig. 26).

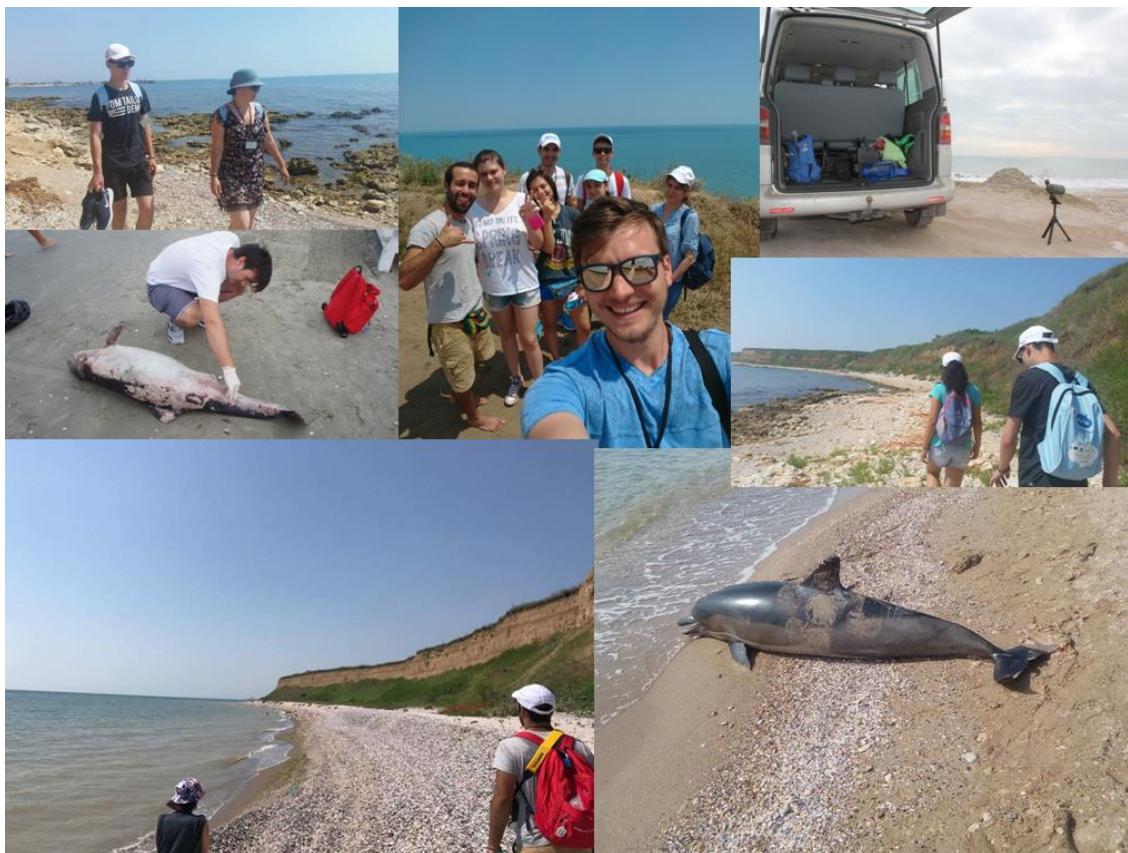

Fig. 26. Land survey with the volunteers in 2017

In two of this surveys were identified stranded cetaceans, calves/juveniles of *Phocoena phocoena relicta* and *Tursiops truncatus ponticus* (Annex 5). In addition the Cetacean Stranding Monitoring Network observers from the 23 schools were covering the sectors monthly (Fig. 27).

Fig. 27. Land surveys done by the CSMN members

The effort from the last years and also from the project reveal that in order to assess the strandings, a stranding network with an emergency line is highly recommended instead of regular monitoring, as the high number of interventions shows(result of the functional stranding monitoring network).

Still land surveys for identifying stranded cetaceans has two major objectives: one **educational** for the volunteers and people involved and second checking of the **remote areas**, where usually peoples are not going and the chances of having information in relation with possible strandings in the area are very low to none.

Concluding, just in 5 of the 22 monitoring expeditions were registered stranded cetaceans. One in Vama Veche and one in Mamaia Nord as showed in the tabel 8.

Tabel 8. Stranding events recorded over land suveys

A8. Activities of awareness for fishermen and decision-makers regarding the need to mitigate the impact of the fisheries and tourism on cetacean populations

One of the key activities of the project was related to the awareness, through awareness campaign and dissemination of the information on the different channels (facebook, newsletter, press release, website, TV interviews etc.) but also on events, meetings, workshop, trainings (scientific sessions, meetings of the Black Sea Advisory Council, MSFD meetings debates, trainings given to the collaborator in order to facilitate a common protocol of intervention in cases of stranded dolphins). For awareness sessions were used fridge magnets, monthly newspaper, www.delfini.ro website and Mare Nostrum's education web portal, not least the facebook page "Delfinii din Marea Neagra/Black Sea dolphins".

On 5th of August was organized the event Dolphin Day, which included an international workshop (with the participation of experts, partners and decision makers), a photo gallery and a treasure hunt game for public (locals and tourists). The workshop gathered 41 persons who were presented projects and initiatives and also the ACCOBAMS Agreement was presented by the Romanian Focal Point through Ms. Camelia Dumitache. The main objective was to raise the need of necessity of assessing the Black Sea cetaceans and to have a better understanding over them.

The events involved more than 300 persons (Fig. 28) in the games and presentations prepared by Mare Nostrum team. The entire event was hosted by the Natural Science Museum of Constanta and was attended by several media channels and newspapers, local and national.

Fig. 28. Pictures from the Dolphin Day event

The event included a Photo exhibition which remained permanent there in order to be visited by the peoples who visit the Museum, estimate that more than 50.000 visitors had the opportunity to enjoy and learn about Black Sea cetaceans and with the new summer season in 2017 was estimated more than 200.000 visitors had the opportunity to enjoy and learn about Black Sea cetaceans, visiting the exhibition at the Natural Science Museum Complex from Constanta. In this way also the partnership with the ACCOBAMS was promoted and people had the chance once again to get aware of ACCOBAMS and its efforts for improving the state of cetaceans from the seas under the agreement and not only (Fig. 29).

Fig. 29. Event poster

On 30 of October 2016, International Black Sea Day, was celebrated, on the Constanta coast with a cross - country called "Run for a clean Black Sea" and educational games for those who could not attend the cross. More than 500 peoples (Fig. 30) run for the Black Sea, and had the chance through the leaflets to learn about cetaceans.

Fig. 30. International Black Sea Day event

The two events were covered also from another project on environmental education financed by OMV Petrom.

The media report for the press relies of the two public events counted 28 articles published with more than 5000 views.

The pressure over cetacean was represented also at the last meeting of the Black Sea Advisory Council for Fisheries in Varna, Bulgaria, where Mare Nostrum is one of the members. From this position the organization has the possibility of working towards diminishing the impact between fisheries and cetaceans. In the same time discussions are carried on with the fishermen from Romania and continue the effort of finding ways to raise their awareness about the important role of marine mammals in the ecosystem.

For general awareness campaigns were used leaflets and frig magnets with the emergency number in case of cetacean in distress. There were organized 2 awareness sessions on the coastal area in summer reaching to locals and tourists in 2016.

Another important meeting at which we had the chance of bringing on the line the needs of a monitoring program for cetaceans was the public hearing for the MSFD national measures plan where Romulus Marian Paiu and Mihaela Mirea Candea were attending.

At the beginning of the Summer season were rolled sessions for promoting the emergency line (0763255731), also spreading magnets with the line (Fig. 31.) to the safeguards and diver, sailors and fishermen, beach managers and authorities. For the Romanian Waters Authority – Dobrogea Litoral we made special trainings for the personal dealing with cleanup of the beach in order to understand

why is important to register the cases, to inform us as soon as possible and also how to manage the carcase and how to collect information (Fig.32.).

Fig. 31. Magnets used in awareness campaigns in order to promote the emergency line and Task Force

Fig. 32. Training for employees of ABADL

The high number of strandings encountered made the project and mostly the Emergency Team Force existence together with the emergency line more visible in media (audio and video, paper) and also over the social networks. We were receiving distress calls from citizens, tourists, authorities and National Emergency Line (112).

DIFFICULTIES ENCOUNTERED AND MEASURES TAKEN TO OVERCOME PROBLEMS

The experience in coordinating project helped in managing this wonderful and necessary project and the continuous focus of Mare Nostrum team in continuing the program of monitoring and conservation of Black Sea cetacean brought the success for the project.

One of the main difficulties raised was because of the delayed date of the training, according to the trainers (Philip Hammond) agenda, which postpone the activities dedicated to the survey. But the delay was taken in consideration from the beginning being included in the timetable of the project proposal, was discussed with the ACCOBAMS Secretariat and we decided that it is better to include it from the beginning. In the end not being a difficulty entirely, the two surveys were made in April (for spring seasons) and in June (for Summer season). But the real difficulty came with the bad weather registered this year at the Romanian Black Sea Area (and not only), strong winds and high waves which made the survey to be postponed several times because of the bad weather, leaving the assessment of data and preparation of the project report outside the project period completed with the high number of strandings which blocked the team on the field for several hours almost every day. The measure taken was to ask for a postpone with one month of the project in order to finish all the activities but also to include as many information as possible related to the strandings.

CHANGES INTRODUCED IN THE IMPLEMENTATION

There were two major modification, one discussed from the previous reporting period – the postpone of the vessel surveys and one related to the project period – extension with one month of the project.

ACHIEVEMENTS/RESULTS

1. The main output of the project in the report period is represented by the marine mammal distribution and abundance estimation training; which added value to Mare Nostrum and riparian countries cetacean research programs/projects in the field of assessment of distribution and abundance of Black Sea cetaceans (common objective with the ACCOBAMS Strategy);
2. 15 specialists/researchers from 5 Black Sea countries (Romania, Bulgaria, Turkey, Georgia and Ukraine) were trained;
3. Establish of a link between the Black Sea cetacean researchers which will be the main source for developing projects. Already have in plan a proposal for Black Sea Cross Border Cooperation Programme;
4. 897 students and 103 teachers recruited, trained, equipped and active for the Cetacean Stranding Monitoring Network;

5. Using Distance 7 software for designing and assessing a survey and completing the methodology used for data collection;
6. 2 surveys in the south part of the Romanian Black Sea territorial waters, one in Spring and one in Summer, 2017;
7. Assessment of the two surveys and establishing the abundance and distribution in the study area and for the periods of the study. Including maps of the cetacean sighted;
8. Establish of a link between the Black Sea cetacean researchers which will be the main source for developing projects. Already had applied for Black Sea Cross Border Cooperation Programme with a project proposal in which was included an aerial survey as support for ASI;
9. 22 land monitoring expeditions for data collection on cetacean stranding, by-catches and near coast appearance (land monitoring reports);
10. 132 emergency interventions with the task force for strandings
11. 2 major public events with more than 1000 persons participating and at least 5000 viewers of the press releases;
12. 3 major events in which participants were informed about the project and the cetacean issues and needs;
13. 1 photo and poster exhibition about cetaceans and research in this field in Romania, with a daily visitor number between 100 (winter season) and 5000 people for June and July;
14. 3 awareness sessions on the beach with more than 2500 tourists and locals approached and informed;
15. Capacity building for Mare Nostrum and riparian organizations participating in the project.
16. All the data collected in the frame of the project will be forwarded to the international database Medaces and Obis Seemap, and also to the representative institutions from Romania and the ACCOBAMS focal point. The data collected in 2016 are already uploaded and those from the 2017 will be uploaded for large dissemination and use till the end of the year.

RECOMMENDATION

It is highly recommended to continue the monitoring of cetaceans in the Black Sea area for more accurate data and estimations of the Black Sea cetacean population, migration pattern and habitats to reveal the real stats of the species and measures to be taken on short, medium and large period.

The human resource formed in the frame of the project should be further use by the agreement and for a basin assessment.

Strictly to Romania, but after discussing with the participants to the training, more of the riparian countries need trainings on necropsy exam and sampling which to be the mile stone for a coherent program of cetacean disease monitoring.

SUMMARY (a short article with the most important outcomes to be published on the website)

The project “Increase the regional capacity for developing cetacean distribution and abundance studies” started in July 2016, under the implementation of Mare Nostrum NGO and financed by the ACCOBAMS Secretariat under Supplementary Conservation Funds.

Within this project, Mare Nostrum aimed to increase the capacity of local and regional researchers to address the issues related to cetacean distribution and abundance, responding in this way to

ACCOBAMS strategic objective on improving understanding of the conservation status of cetaceans in Black Sea. Also, is assured continuity, quality and quantity of data regarding Romanian Black Sea cetaceans and is increased awareness and involvement of local population and tourists in cetacean conservation (stranding monitoring network, task force, emergency, appropriate behaviour, etc.)

The first half of the project were crowned with several notable results that contribute to achieving the objectives mentioned above. The main output for the reporting period is represented by the marine mammal distribution and abundance estimation training, which added value to Mare Nostrum and riparian countries cetacean research programs/projects in the field of assessment of distribution and abundance of Black Sea cetaceans, this being a common objective with the ACCOBAMS Strategy. Thus, were trained 15 specialists/researchers from 5 Black Sea countries (Romania, Bulgaria, Turkey, Georgia and Ukraine). This training established a link between Black Sea cetacean researchers and were developed new partnerships for further projects, as a proposal for Black Sea Cross Border Cooperation Programme.

The second half of the project meant the period in which to apply all the knowledge gathered true designing and achieving 2 trial surveys for the South part of the territorial waters of Romania, one in Spring and one in Summer. Over the two surveys were recorded 275 sightings with 477 animals from all the three species in the Black Sea. There are rough estimations of the abundance and distribution maps for the surveyed area.

Cetacean Stranding Monitoring Network, which had enrolled for the project period 1000 students and teachers, together with the Emergency Task Force managed a very good coverage of the stranding recorded at the Romanian coast recording 132 stranding events. The 110 strandings recorded just in 2017, unfortunately it meant almost a negative “record” being close to the situation in 2012 when we were recording for the entire year 177 dead stranded cetaceans.

To support the effort for recording the stranding events, were conducted 22 land monitoring expeditions for data collection on cetacean stranding, by-catches and near coast appearance and had awareness sessions for making public the emergency number on which people can alarm a stranding (dead or alive).

The local community has supported us and answered in a positive way to the project and shared the information, media was making numerous articles to signal the danger over the cetaceans and sharing the emergency line. The 2 major public events (Dolphin Day and International Black Sea Day) to which participated more than 1000 persons, together with the press releases and articles published, the poster exhibition about cetacean and research in Romanian established in the Natural History Museum from Constanta and the awareness campaigns brought visibility over the emergency line and the activities under the project.

The project and Mare Nostrum activity attracted foreign students willing to come and work with us at the implementation of the activities, in this way both reporting periods we had the pleasure of working with students from Czech Republic and Spain, Barbora and Raul which we want to acknowledge for their effort and dedication.

And not least we like to thank Philip S. Hammond from University of St Andrews, Sea Mammal Research Unit, for the great help that he was giving to the project in all the activities related to cetacean assessment.

All the data collected under the project, related to sightings and strandings will be available on OBIS Seamap portal till the end of 2017.

Estimating marine mammal abundance and life history parameters

12-16 December 2016, Constanta, Romania

11 December 2016 – 20:00 Diner at Restaurant Rustic, Constanta

Day 1. 12 December 2016

9:00-9:30	Registration
9:30	1. Introduction to Workshop
10:00	Coffee break
11:00	2. Introduction to mark-recapture methods
12:30	LUNCH
13:30	3. Mark-recapture data collection: Sampling design, photo-identification, turning photos into data
14:30	4. Mark-recapture abundance estimation: Two-sample model analysis in Excel (practical)
15:30	Coffee break
15:45	5. Mark-recapture data analysis: Capture histories, survival rates, abundance, open and closed models, heterogeneity of capture probabilities
17:00	6. Using MARK: Multi-sample abundance estimation using closed models (practical)
19:00	Dinner

Day 2. 13 December 2016

9:00	6. Using MARK: Continue data analysis using closed models (practical)
------	--

10:30	Coffee break
10:45	7. Using MARK: Open model survival rate and abundance estimation (practical)
12:30	LUNCH
13:30	8. Using MARK: Continue data analysis using closed/open models (practical)
15:30	Coffee break
15:45	9. Introduction to life table analysis
16:30	10. Life table analysis: Estimating mortality and birth rates from strandings data (practical)
19:00	Dinner

Day 3. 14 December 2016

09:00	11. Introduction to line transect (distance) sampling, including survey design
09:45	12. Using DISTANCE: Survey design in DISTANCE (practical)
10:30	Coffee break
11:15	13. Line transect data collection Including introduction to survey practical
12:30	LUNCH
13:30	14. Line transect survey (practical)
15:30	Coffee break
16:00	15. Line transect: organization of data from survey (practical)
19:00	Dinner

Day 4. 15 December 2016

9:00	16. Using DISTANCE: Data entry (practical)
10:30	Coffee break

10:45	17. Line transect data analysis: Detection functions, diagnostics, abundance estimation, variance estimation
12:30	LUNCH
13:30	18. Using DISTANCE: Survey data analysis (practical)
15:30	Coffee break
16:00	18. Using DISTANCE: Survey data analysis continued (practical)
19:00	Dinner

Day 5. 16 December 2016

9:00	19. Conclusions from analysis of survey data
9:45	20. Animals missed on the transect line: Including responsive movement and double team line transect
10:30	Coffee break
10:45	21. Population status and trends, including power analysis
11:20	22. Population Viability Analysis , including VORTEX
12:30	LUNCH
13:30	23. Additional data analysis; discussion of issues not yet covered
15:00	Coffee break
15:30	24. Conclusions and Close of Workshop
20:00	Dinner at Restaurant Integra

RAPORT DE EXPEDIȚIE 1

1. Tipul expediției: terestră

2. Data: 13.07.2016

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Marian PAIU

- Dragoș Șumilă
- Barbora Bartova

4. Locul desfășurării observației:

- Codul sectorului: 18 - 35
- Repere sector: Constanța - Periboina

5. Descrierea activității în sine:

- a. Prezență delfin eşuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer însorit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu au fost observate cetacee eșuate.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum, ATV și pe jos.

RAPORT DE EXPEDIȚIE 2

1. Tipul expediției: terestră

2. Data: 19.07.2016

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Marian PAIU

- Dragoș Șumilă
- Camelia Cufioti
- Gheorghe Anca
- Craciun Mariela
- Aldea Andreea
- Abalaru Adela
- George Rachieru

4. Locul desfășurării observației:

- Codul sectorului: 18 - 31
- Repere sector: Vama Veche - Constanța

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA X NU

b. Completare *Fișă de Observație* DA X NU

6. Observații:

Cer însoțit, parțial acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției au fost observate două cetacee eșuate, aparținând speciei *Phocoena phocoena relicta*. Acesta a fost preluat pentru incinerare.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 3

1. Tipul expediției: terestră

2. Data: 28.07.2016

3. Componența grupei de observatori voluntari
(a se specifică CL – Coordonator Local): Marian PAIU

- Sumila Dragos
- Vlad Radu-Stefan
- Milcu Ana-Maria
- Ionica Mihai
- Talpau Theodora Daria
- Iordache Ruxandra
- Mihai Andrei-Alexandru

4. Locul desfășurării observației:

- Codul sectorului: 18 - 35
- Repere sector: Constanța - Periboina

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer însorit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu au fost observate cetacee.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

RAPORT DE EXPEDIȚIE 4

1. Tipul expediției: terestră

2. Data: 03.08.2016

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Sumila Dragos

- Aldea Andreea
- Stanila Andrei Nicolae
- Rachieru George
- Minescu Andrei

4. Locul desfășurării observației:

- Codul sectorului: 1 - 18
- Repere sector: Vama Veche - Constanța

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer însorit, parțial acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 5

1. Tipul expediției: terestră

2. Data: 18.08.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local): Sumila Dragos

- Aldea Andreea
- Craciun Mariela
- Vizireanu Ioan-Iulian
- Vizireanu Andrei-Cristian
- Samargiu Vlad-Costin
- Pocriste Catalina

4. Locul desfășurării observației:

- Codul sectorului: 18-32
- Repere sector: Constanța-Vadu

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU

b. Completare *Fișă de Observație* DA NU

6. Observații:

Cer însorit, parțial acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 6

1. Tipul expediției: terestră

2. Data: 25.08.2016

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Sumila Dragos

- Filip Smaranda
- Rachieru George
- Mociu Cosmina
- Cufioti Camelia-Alexandra
- Branescu Bianca
- Milcu Ana-Maria
- Lalangi Bianca-Elena
- Cucinschi Evelina
- Rata Stefan
- Stanga stefania

4. Locul desfășurării observației:

- Codul sectorului: 1 - 16
- Repere sector: Vama Veche - Eforie Nord

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU

b. Completare *Fisă de Observație* DA NU

6. Observații:

Cer însorit, parțial acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu două autoturisme personale și pe jos.

RAPORT DE EXPEDIȚIE 7

1. Tipul expediției: terestră

2. Data: 31.08.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local): Sumila Dragos

- Aldea Andreea
- Samargiu Vlad-Costin
- Vicol Mihai
- Radoi Victor Andrei
- Efrem Cristian-Pavel
- Iliescu Teodora
- Calatoiu Ioan

4. Locul desfășurării observației:

- Codul sectorului: 18-32
- Repere sector: Constanța-Vadu

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU X

b. Completare *Fisă de Observație* DA NU X

6. Observații:

Cer însorit, parțial acoperit, vânt puternic, valuri mari.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 8

1. Tipul expediției: terestră

2. Data: 16.09.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local):Paiu Marian

- Sumila Dragos
- Camelia Cufioti

4. Locul desfășurării observației:

- Codul sectorului: 18-32
- Repere sector: Constanta-Vadu

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU

b. Completare *Fișă de Observație* DA NU

6. Observații:

Cer însozit, vânt puternic, valuri mari.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și cu ATV-ul.

RAPORT DE EXPEDIȚIE 9

1. Tipul expediției: terestră

2. Data: 17.09.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local):Sumila Dragos

- Mociu Cosmina
- Ialangi Bianca
- Calistru Diana
- Florescu Lorela
- Milcu Ana-Maria
- Gheorghe Anca
- Cufioti Camelia

4. Locul desfășurării observației:

- Codul sectorului: 18-1
- Repere sector: Constanta-Vama Veche

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU

b. Completare *Fișă de Observație* DA NU

6. Observații:

Cer însorit, vânt slab, valuri mici.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 10

1. Tipul expediției: terestră

2. Data: 1.10.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local):Sumila Dragos

- Samargiu Vlad-Costin

- Rachieru George
- Mociu Cosmina
- Kessler Dan Valeriu
- Mustafa Sezen
- Craciun Mariela Madalina
- Ialangi Bianca-Elena

4. Locul desfășurării observației:

- Codul sectorului: 18-1
- Repere sector: Constanta-Vama Veche

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer însorit, vânt slab, valuri mici.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 11

1. Tipul expediției: terestră

2. Data: 12.10.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local):Paiu Marian

- Angelica Paiu
- Anca Gheorghe
- Patricia Tomasian

- Cufioti Camelia
- Candea Mirea Mihaela

4. Locul desfășurării observației:

- Codul sectorului: 18
- Repere sector: Constanta

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA X NU

b. Completare *Fisă de Observație* DA X NU

6. Observații:

Cer aproape total acoperit, vânt moderat, valuri mari.

Pe parcursul expediției a fost observat un cetaceu eșuat apartinand speciei *Phocoena phocoena relicta*.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos

RAPORT DE EXPEDIȚIE 12

1. Tipul expediției: terestră

2. Data: 19.11.2016

3. Componența grupei de observatori voluntari
(a se specifica CL – Coordonator Local):Sumila Dragos

- Sabau Raul
- Rachieru George
- Ibraim Yasin
- Cufioti Camelia

a. Prezență delfin eșuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer însorit, vânt slab, valuri mici.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 13

1. Tipul expediției: terestră

2. Data: 28.11.2016

3. Componența grupei de observatori voluntari

(a se specifică CL – Coordonator Local): Paiu Marian

- Sumila Dragos
- Rachieru George

4. Locul desfășurării observației:

- Codul sectorului: 18-35
- Repere sector: Constanta-Periboina

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele materiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și cu ATV-ul.

RAPORT DE EXPEDIȚIE 14

1. Tipul expediției: terestră

2. Data: 28.12.2016

3. Componența grupei de observatori voluntari
(a se specifică CL – Coordonator Local): Paiu Marian

- Gheorghe Anca
- Rachieru George
- Paiu Angelica

4. Locul desfășurării observației:

- Codul sectorului: 1- 18
- Repere sector: Vama Veche- Constanța

5. Descrierea activității în sine:

c. Prezență delfin eșuat DA NU X

d. Completare *Fișă de Observație* DA NU

6. Observații:

Cer acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu a fost observat un cetaceu eșuat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și cu ATV-ul.

RAPORT DE EXPEDIȚIE 15

1. Tipul expediției: terestră

2. Data: 31.01.2017

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Marian PAIU

- Paiu Angelica
- Paiu Alexandru
- Robert Mirea
- Dan Kessler

4. Locul desfășurării observației:

- Codul sectorului: 1 - 31
- Repere sector: Vama Veche - Corbu

5. Descrierea activității în sine:

c. Prezență delfin eșuat DA NU

d. Completare *Fișă de Observație* DA NU

6. Observații:

Cer acoperit în totalitate, vânt moderat spre tare, valuri mijlocii.

Pe parcursul expediției a fost observat un cetaceu eșuat, mort, aparținând speciei *Phocoena phocena relicta* cu urme de plasă și plăgi, datorate cel mai probabil pescărușilor, în zona ochilor. Exemplarul a fost preluat pentru investigații și depozitat în cadrul INCDM Grigore Antipa, Constanța. Urmând a fi incinerat.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum, ATV și pe jos.

RAPORT DE EXPEDITIE 16

1. Tipul expediției: terestră

2. Data: 26.02.2017

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Marian PAIU

- Dragos Viceaga
- Anca Gheorghe
- Maria Viceaga
- Patru Dan

4. Locul desfășurării observației:

- Codul sectorului: 1 - 32
- Repere sector: Vama Veche - Vadu

5. Descrierea activității în sine:

c. Prezență delfin eșuat DA NU X

d. Completare *Fișă de Observație* DA NU X

6. Observații:

Cer acoperit, ceată groasă dar care în orele următoare s-a risipit ieșind soarele, vânt moderat spre tare până la finalul expediției, valuri mici la primele ore ale dimineții ce s-au mărit pe parcursul zilei.

Pe parcursul expediției nu au fost observate cetacee eșuate.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDITIE 17

1. Tipul expediției: terestră

2. Data: 30.03.2017 – 4.04.2017

3. Componența grupei de observatori voluntari
(a se specifică CL – Coordonator Local): Marian PAIU

- Angelica Paiu
- Mihaela Candea Mirea
- Ionica Mihai
- Diana Manzala
- Patricia Tomasian
- Anca Gheorghe
- Andra Fratila

4. Locul desfășurării observației:

- Codul sectorului: 1 - 32
 - Repere sector: Vama Veche – Vadu

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Observațiile au fost efectuate pe parcursul mai multor zile datorita condițiilor meteorologice precare, ploaie și vânt puternic.

Pe parcursul expediției nu au fost observate cetacee eșuate.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDITIE 18

1. Tipul expediției: terestră

2. Data: 08.04.2017

3. Componența grupei de observatori voluntari

(a se specifica CL – Coordonator Local): Marian PAIU

- Raul Zabala Belenguer
- Popescu George
- Olariu Bogdan
- Mara Osneanu
- Mara Preda
- Balcescu Stefan
- Parita Andrei
- Ionescu Victor
- Maria Barba

4. Locul desfășurării observației:

- Codul sectorului: 1-30
 - Repere sector: Vama Veche - Navodari

5. Descrierea activității în sine:

a. Prezență delfin eșuat DA NU

b. Completare *Fișă de Observație* DA NU

6. Observații:

Observațiile au fost efectuate cu ajutorul unui grup de voluntari, veniti din Bucuresti, pentru a afla mai multe despre cetaceele din Marea Neagră. Neidentificând nici un

delfin eşuat am derulat un scenariu cu ajutorul unui manechin în formă de delfin pentru a-i instrui cu privire la ce au de făcut atunci când întalnesc cazuri de esuare.

Pe parcursul expediției nu au fost observate cetacee eşuate.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele materiale: o pungă ermetică și o ruletă.

Expediția a fost realizată cu autoturismul Mare Nostrum și pe jos.

RAPORT DE EXPEDIȚIE 19

1. Tipul expediției: terestră

2. Data: 27.04.2017

3. Componența grupei de observatori voluntari

(a se specifică CL – Coordonator Local): Marian PAIU

- Raul Zabala Belenguer
- Robert Mirea

4. Locul desfășurării observației:

- Codul sectorului: 1-20
 - Repere sector: Vama Veche - Constanța

5. Descrierea activității în sine:

a. Prezență delfin eşuat DA NU X

b. Completare *Fișă de Observație* DA NU X

6. Observații:

Observațiile au fost efectuate de echipa Mare Nostrum, utilizând atât atv-ul cât și microbuzul organizației. Condițiile meteo în prima parte a zilei au fost mai puțin prielnice prin ceața groasă ce acoperea orizontul însă aceasta s-a disipat în cea de-a doua parte a zilei, vânt moderat și valurii mijlocii.

Pe parcursul expediției nu au fost observate cetacee eșuate.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

RAPORT DE EXPEDIȚIE 20

1. Tipul expediției: terestră

2. Data: 16.05.2017

3. Componența grupei de observatori voluntari
(a se specifică CL – Coordonator Local):Paiu Marian

- Raul Zabala
- Stanila Andrei Nicolae
- Anca Gheorghe
- Ionica Mihai
- Vlad Samargiu
- Andrei Radoi

4. Locul desfășurării observației:

- Codul sectorului: 1 - 32
- Repere sector: Vama Veche - Vadu

5. Descrierea activității în sine:

c. Prezență delfin eșuat DA X NU

d. Completare *Fisă de Observație* DA X NU

6. Observații:

Cer însorit, parțial acoperit, vânt moderat, valuri mijlocii.

Pe parcursul expediției a fost observat un pui de afalin (*Tursiops truncatus ponticus*).

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.

6. Observații:

Cer însorit, vânt moderat, valuri mijlocii.

Pe parcursul expediției nu au fost observate cetacee.

Pentru o buna desfășurare a expediției pe lângă obiectele necesare (aparat foto, hartă, fișă de observație + pix, GPS, binoclu și trusă pentru analizele de apă) s-au mai utilizat următoarele matereiale: o pungă ermetică și o ruletă.
